TOKENOMICS

Total Supply: 1,000,000,000,000

Goes to LOCKED Liquidity on every transaction.	**6%**
Goes to the BURN wallet automatically to reduce circulating supply	**3%**
Goes to wallet Holders on the Blockchain	**1%**

Overview

Burn King Protocol (BKP) token is an autonomous yield and liquidity generation protocol. Every time someone buys or sell BKP token, the total supply goes down and the Holders get rewarded. Burn King Protocol works by assessing a 10% tax on every transaction.

Every wallet Holder on the chain automatically receives token rewards from a 1% redistribution on every transaction.

The Burn wallet receives 3% of every transaction, which causes the circulating supply to go down. This also creates a rise in the floor price.

In addition to the two dynamic features above, each transaction also creates a 6% liquidity tax, which is automatically LOCKED on PancakeSwap.
